                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents an lytic peptide which is used in the course of the inventin to produce transgenic poinsettia plants with increased resistance to pathogens. The specification describes methods for the in vitro regeneration of Poinsettia. Transgenic Poinsettia can now be produced with e.g. increased resistance to pathogens or insects; controllable flower colour; modified habit (more compact form, earlier
                  AAW99125 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              In vitro regeneration of Poinsettia - us containing casein hydrolysate, used to pu with, e.g. increased disease resistance, altered habit and flowering time
                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Blowers

The present invention also describes a method of conferring microbial resistance on a plant cell comprising transforming the cell to express two peptides selected from the magainin and PGL classes, where the peptides are separately compartmentalised. The antimicrobial peptide is effective against phytopathogenic microbes including bacteria, fungi, and phytoplasma. It can also be used to target other plant pests, such as nematodes and viruses. The nucleic acid sequence encoding the peptide can be used to transform plants to provide antimicrobial resistance. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antimicrobial peptides (styelins) (and acetylated forms, salts, amides and esters of styelins), isolated from Styela clava and characterized by specific patterns of basic and hydrophobic amino acid side chains which display a broad spectrum of antimicrobial activities. The peptides are of a specified formula and display a wide range of antimicrobial activities and are therefore useful for preserving materials susceptible to microbial degradation, for protecting plants against bacterial infection and in the therapeutic and prophylactic protection of animals against bacteria, fungiand viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;

To G1 is attached NH2 and to N22 is attached OH.

Magainins are a class of substantially pure, homogeneous
polypeptides composed exclusively of about 25 amino acids, having a
mol. wt. of about 2500 or less, being water soluble at a concentration
of greater than 5 mg/ml at neutral pH or in an aq. solution of
physiologic ionic strength. They are amphiphilic surface-seeking and have
                                                                                                                                                                                                                                                                                                                                                                                    Magainin polypeptide; cytotoxic agent; antimicrobial agent; therapeutic; antilleukaemia; AIDS; HTLV III.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sol. and non-cytolytic to animal cells, incl. RBCs ,and is amphiphilic. It is an active antimicrobial agent being effective against both Gram-positive and -negative bacteria. It is also effective against fungi and protozoa. It is therefore useful as an antibiotic. See also AAP71206-07

                                                                 Analogues have the same activity as Megainin I and II coupled with insignificant haemolytic action against human red blood cells. Useful as antibiotics, fungicides, spermicicdes, in destroying tumors and as preservatives and in sterilisation of food etc.
                                                                                                                                        Deletion analogues of Magainin I and II peptide(s) - having high activity against microorganisms with low haemolytic action against human red blood cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a broad spectrum of properties at physiologic ionic strength and pH. The polypeptide is a microbial agent capable of inhibiting the growth or proliferation of gram-positive and gram-negative bacteria, fungi, virus and protozoan species. They are also useful as therapeutic cytotoxic agents. This includes antitumour activity. They are useful as spermicides and as a contraceptive agent. Magainin is active against HTLV III in vitro and has the potential to reduce the infectivity of the AIDS virus indicating its use as a serilant against the virus or as a chemotherapeutic agent for treating sterilant against the virus or as a chemotherapeutic agent for treating

Analogues have the same activity as Megainin I and II coupled with insignificant haemolytic action against human red blood cells. Useful as antibiotics, fungicides, spermicicdes, in destroying tumors and as preservatives and in sterilisation of food etc.
                                                                       Deletion analogues of Magainin I and II peptide(s) - having high activity against microorganisms with low haemolytic action against human red blood cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analogues have the same activity as Megainin I and II coupled with insignificant haemolytic action against human red blood cells. Useful as antibotics, fungicides, spermicicdes, in destroying tumors and as preservatives and in sterilisation of food etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Deletion analogues of Magainin I and II peptide(s) - having high activity against microorganisms with low action against human red blood cells.

                                                                                               The substitution analogue has biological activity equal to or greater than the parent Magainin II peptide. The analogue is effective as antibiotic and can be used to inhibit, prevent or destroy the growth or proliferation of microbes such as Grampositive and Grampegative bacteria, fungi, viruses and protozoa. It can also be used as a spermicide to inhibit, prevent or destroy the motility of sperm and as anti-tumour agent to inhibit the growth of or destroy tumours.

                Magainin I; magainin II; substitution analogue; antibiotic; antiviral; antitumour.
                                                       Magainin
                                                                                                                                                                                                                                                                                      The substitution analogue has biological activity equal to or greater than the parent Magainin II peptide. The analogue is effective as antibiotic and can be used to inhibit, prevent or destroy the growth or proliferation of microbes such as Grampositive and Grampegative bacteria, fungi, viruses and protozoa. It can also be used as a spermicide to inhibit, prevent or destroy the motility of sperm and as anti-tumour agent to inhibit the growth of or destroy tumours.

                                                                                                                 The substitution analogue has biological activity equal to or greater than the parent Magainin II peptide. The analogue is effective as antibiotic and can be used to inhibit, prevent or destroy the growth or proliferation of microbes such as Grampositive and Grampegative bacteria, fungi, viruses and protozoa. It can also be used as a spermaicide to inhibit, prevent or destroy the motility of sperm and as anti-tumour agent to inhibit the growth of or destroy tumours. See also AAR10639-47, AAR10657-63 and AAR10999.

-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: HIGHEST EXPRESSION IN FAT BODY AND HEMOCYTES.
-!- TIS ALSO EXPRESSED IN MALPICHIAN TUBE AND TO A MUCH LESSER EXTENT IN MIDGUT. NOT PRESENT IN SILK GLAND.
-!- SIMILARITY: BELONGS TO THE CECROPIN FAMILY.

-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
CASEIN KINASE I SUBFAMILY.
                                                                                                                                                                                                            "Ovine casein kinase I alpha gene.";
Submitted (NOV-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: CASEIN KINASES ARE OPERATIONALLY DEFINED BY THEIR
PREFERENTIAL UTILIZATION OF ACIDIC PROTEINS SUCH AS CASEINS
AS SUBSTRATES. IT CAN PHOSPHORYLATE A LARGE NUMBER OF PROTEINS.
                                                                                                                                                                                                                                                                                                                                                      SEQUENCE FROM N.A.

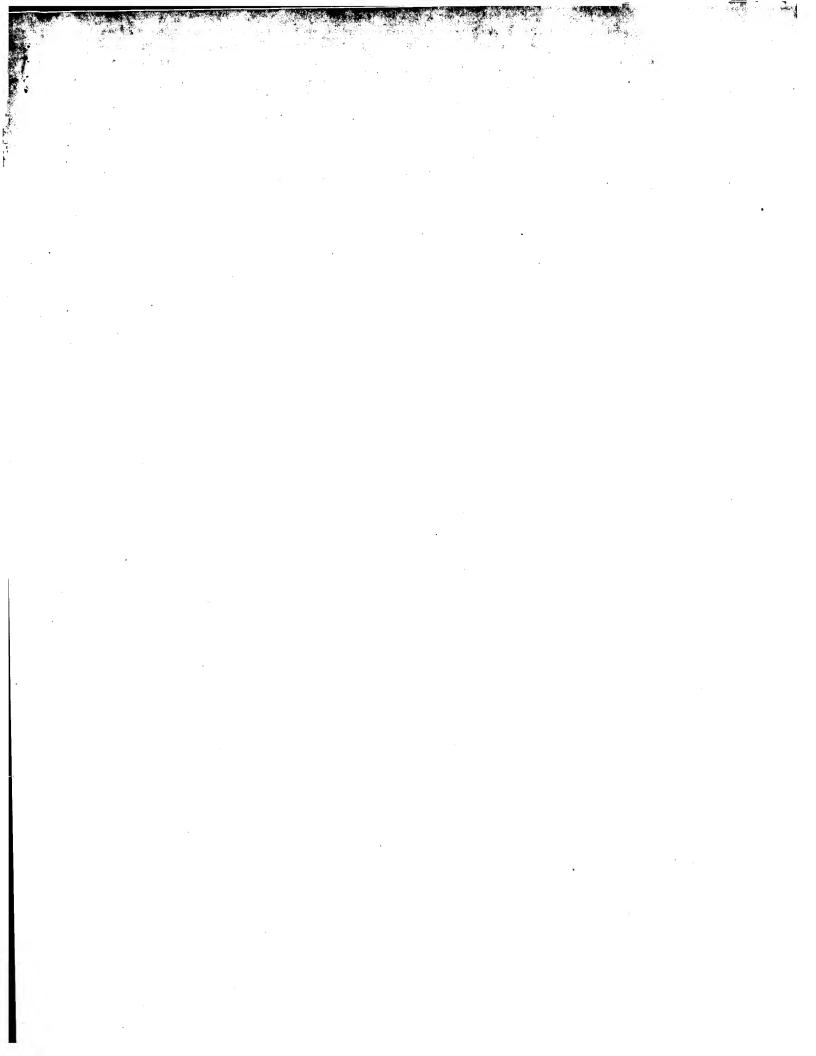

SPECIES=Rabbit; TISSUE=Skeletal muscle;
Zhai L., Depaoli-Roach A.A., Roach P.J.;
Submitted (JUL-1996) to the EMBL/GenBank/DDBJ databases.
                                                                                                                                                                                                                                                                                                                                                                                                                                      SEQUENCE FROM N.A., AND PARTIAL SEQUENCE.
